# Preliminaries

$PG(2, q)$

ARC : set  $\mathcal{K}$  no 3-collinear points

Example

COMPLETE ARC  $\mathcal{K}$ :  $\nexists \tilde{\mathcal{K}}$  arc  $\mid \mathcal{K} \subsetneq \tilde{\mathcal{K}}, \mid \mathcal{K} \mid < \mid \tilde{\mathcal{K}} \mid$

## Preliminaries

 $PG(2, q)$  $(n, 3)$ -arc:set  $\mathcal{K}$  no 4-collinear points  
contains 3-collinear pointsCOMPLETE  $(n, 3)$ -arc  $\mathcal{K}$ : $\nexists \tilde{\mathcal{K}}(n, 3) - \text{arc}, |\mathcal{K}| \notin \tilde{\mathcal{K}}, |\mathcal{K}| < |\tilde{\mathcal{K}}|$

# Singleton bound

$[n, k, d]_q$  linear code

# Singleton bound

$[n, k, d]_q$  linear code

Singleton bound:  $d \leq n - k + 1$

# Singleton bound

$[n, k, d]_q$  linear code

Singleton bound:  $d \leq n - k + 1$

MDS codes:  $d = n - k + 1$

# Singleton bound

$[n, k, d]_q$  linear code

Singleton bound:  $d \leq n - k + 1$

MDS codes:  $d = n - k + 1$

Singleton defect of a linear code  $C$ :  $s(C) = n - k + 1 - d$

# Singleton bound

$[n, k, d]_q$  linear code

Singleton bound:  $d \leq n - k + 1$

MDS codes:  $d = n - k + 1$

Singleton defect of a linear code  $C$ :  $s(C) = n - k + 1 - d$

MDS codes:  $s(C) = 0$

# Singleton bound

$[n, k, d]_q$  linear code

Singleton bound:  $d \leq n - k + 1$

MDS codes:  $d = n - k + 1$

Singleton defect of a linear code  $C$ :  $s(C) = n - k + 1 - d$

MDS codes:  $s(C) = 0$

AMDS codes:  $s(C) = 1$

# Singleton bound

$[n, k, d]_q$  linear code

Singleton bound:  $d \leq n - k + 1$

MDS codes:  $d = n - k + 1$

Singleton defect of a linear code  $C$ :  $s(C) = n - k + 1 - d$

MDS codes:  $s(C) = 0$

AMDS codes:  $s(C) = 1$

NMDS codes:  $s(C) = 1 = s(C^\perp)$

# NMDS codes

## Theorem

A linear  $[n, k, d]$  code  $C$  is NMDS if and only if a generator matrix of  $C$ , say  $G$ , (and consequently each generator matrix) satisfies the following conditions:

1. any  $k - 1$  columns of  $G$  are linearly independent;
2. there exist  $k$  linearly dependent columns in  $G$ ;
3. any  $k + 1$  columns of  $G$  are of full rank

$$[n, 3, n - 3] \text{ NMDS codes} \iff (n, 3)\text{-arcs of } PG(2, q)$$

S.M. Dodunekov and I. Landjev, On near-MDS codes,  
J. Geometry 54 (1995), 30-43.

$(n, 3)$ -arcs

## Definition

$m_3(2, q)$  : maximum length of an  $(n, 3)$ -arc of  $PG(2, q)$

$t_3(2, q)$  : minimum length of a complete  $(n, 3)$ -arc of  $PG(2, q)$

## Theorem

$m_3(2, q) \leq 2q + 1$ , for  $q \geq 4$

J. Thas, Some results concerning  $((q + 1)(n - 1), n)$ -arcs,  
J. Combin. Theory Ser. A 19 (1975), 228-232.

# Constraints on solution: size of arc contained II

# Constraints on solution: size of arc contained II

Let  $C'$  be the  $(n, 3)$ -arc to extend and  $C$  be the  $(s, 2)$ -arc contained in  $C'$ .

We collect in a table all the pairs  $(P, Q), P, Q \in PG(2, q) \setminus C'$  such that:

$$\exists R \in C \mid (C \setminus \{R\}) \cup \{P, Q\} \text{ is an } (s+1, 2)\text{-arc.}$$

When adding a point  $P$  to the partial solution, all the points  $Q$  such that the pair  $(P, Q)$  is in the table are avoided.

# Constraints on solution: size of arc contained III

## Constraints on solution: size of arc contained III

**Trade – off** between the number of eliminated points and the computational cost of searching a sub-arc inside a  $(n, 3)$ -arc

At a certain level of the backtracking, random control to test if the the partial solution contains an arc too big.

In this case that branch of the search space can be pruned.

# Constraints on solution: distribution of the candidates points on secants

Constraint on the distribution of the candidates points on the secants of the  $s$ -arc that the solution  $(n, 3)$ -arc contains

Arcs in Finite Projective Planes, G.R. Cook, PhD Thesis,  
Univ. of Sussex(2011)  
available on internet <http://sro.sussex.ac.uk/>

# Constraint: distribution of candidates points on secants

To each secant, only one point can be added to obtain an  $(n, 3)$ -arc

Line	Points contained	$\beta$
$l_1$	$P_1, P_2, P_3, P_4$	3
$l_2$	$P_5, P_6, P_7, P_8$	2

constructing an  $(8, 3)$ -arc choose the  $i$ -th points in lines  $\beta$ ,  $\beta < i$

More effective when searching for big  $(n, 3)$ -arcs

Results: maximal  $(n, 3)$ -arcs in  $PG(2, 16)$ 

## Theorem

*The maximum size of complete  $(n, 3)$ -arcs in  $PG(2, 16)$  is 28.  
There exists a unique  $(28, 3)$ -arc.*

**Table:** Execution time of the search for  $(n, 3)$ -arcs in  $PG(2, 16)$  with  $n \geq 29$  containing an arc  $\mathcal{A}$

$ \mathcal{A} $	8	9	10	11	12	13	14	15	16	17
Time	2 d	22 d	20 d	4 d	2 d	1.2 h	15 m	3 m	< 1 m	< 10s

The complete  $(28, 3)$ -arc is an example of  $(1, 18)$ -saturating set with  $\mu$ -density  $\delta = 1.285714$  (see [B.D.G.M.P. ACCT2012]).

# Results about NMDS codes

In the language of coding theory, the previous Theorem can be rewritten as:

## Theorem

*No  $[29, 3, 26]_{16}$ -code exists.*

# Results about NMDS codes

In the language of coding theory, the previous Theorem can be rewritten as:

## Theorem

*No  $[29, 3, 26]_{16}$ -code exists.*

## Corollary

*No  $[29 + h, 3 + h, 26]_{16}$ -code exists,  $h \geq 1$ .*

## Proof.

Otherwise a  $[29, 3, 26]_{16}$ -code could be obtained by shortening.  $\square$

# Results about NMDS codes

In the language of coding theory, the previous Theorem can be rewritten as:

## Theorem

*No  $[29, 3, 26]_{16}$ -code exists.*

## Corollary

*No  $[29 + h, 3 + h, 26]_{16}$ -code exists,  $h \geq 1$ .*

## Proof.

Otherwise a  $[29, 3, 26]_{16}$ -code could be obtained by shortening.  $\square$

The corollary closes, for  $h \leq 27$ , some open cases in tables of MinT online database, <http://mint.sbg.ac.at>

# Results about NMDS codes

## Theorem

*There exists no  $[29, 4, 25]_{16}$  NMDS code.*

## Proof.

0	[28, 3, 25] <sub>16</sub> code
0	
0	
1	vector of weight at least 24

Results: smallest complete  $(n, 3)$ -arcs in  $PG(2, 16)$ 

## Theorem

*The minimum size of complete  $(n, 3)$ -arcs in  $PG(2, 16)$  is 15.  
There exists a unique complete  $(15, 3)$ -arc in  $PG(2, 16)$ .  
It contains a  $(9, 2)$ -arc, but not a greater arc.*

## Proof.

Exhaustive search for  $(n, 3)$ -arcs with  $n \leq 14$ .

It lasted 11 days on a 3.2 Ghz CPU.

Classification lasted 45 days on a 3.2 Ghz CPU.

Results: smallest complete  $(n, 3)$ -arcs in  $PG(2, 16)$ Table: The complete  $(15, 3)$ -arc in  $PG(2, 16)$ 

Points	$l_0$	$l_1$	$l_2$	$l_3$	G
1 0 0 1 1 1 1 1 1 1 1 1 1 1 1	92	138	12	31	$\mathcal{S}_3$
0 1 0 1 0 1 2 2 4 9 9 11 11 13 13					
0 0 1 1 11 8 5 10 10 2 8 2 11 1 12					

$GF(16) = \{0, 1 = \alpha^0, 2 = \alpha^1, \dots, 15 = \alpha^{14}\}$ ,  $\alpha$  primitive element such that  $\alpha^4 + \alpha^3 + 1 = 0$ .

# Results in $PG(2, 17)$

## Theorem

*There exist no complete  $(n, 3)$ -arcs in  $PG(2, 17)$ , with  $n > 28$  containing an arc of size greater than 12.*

## Theorem

*The smallest size of complete  $(n, 3)$ -arcs in  $PG(2, 17)$  is at most 18. There exist no complete  $(n, 3)$ -arcs in  $PG(2, 17)$ , with  $n \leq 17$  containing an arc of size less than 8.*

# Results in $PG(2, 19)$

## Theorem

*The maximum size of complete  $(n, 3)$ -arcs in  $PG(2, 19)$  is at least 31. There exist no complete  $(n, 3)$ -arcs in  $PG(2, 19)$ , with  $n \geq 31$  containing an arc of size greater than 14.*

## Theorem

*The smallest size of complete  $(n, 3)$ -arcs in  $PG(2, 19)$  is at most 20.*
